The colours of panel (b) (Zonal mean temperature) have been inverted in order to show the models–reanalyses difference as in the figure description. The previous version erroneously showed reanalyses–models.

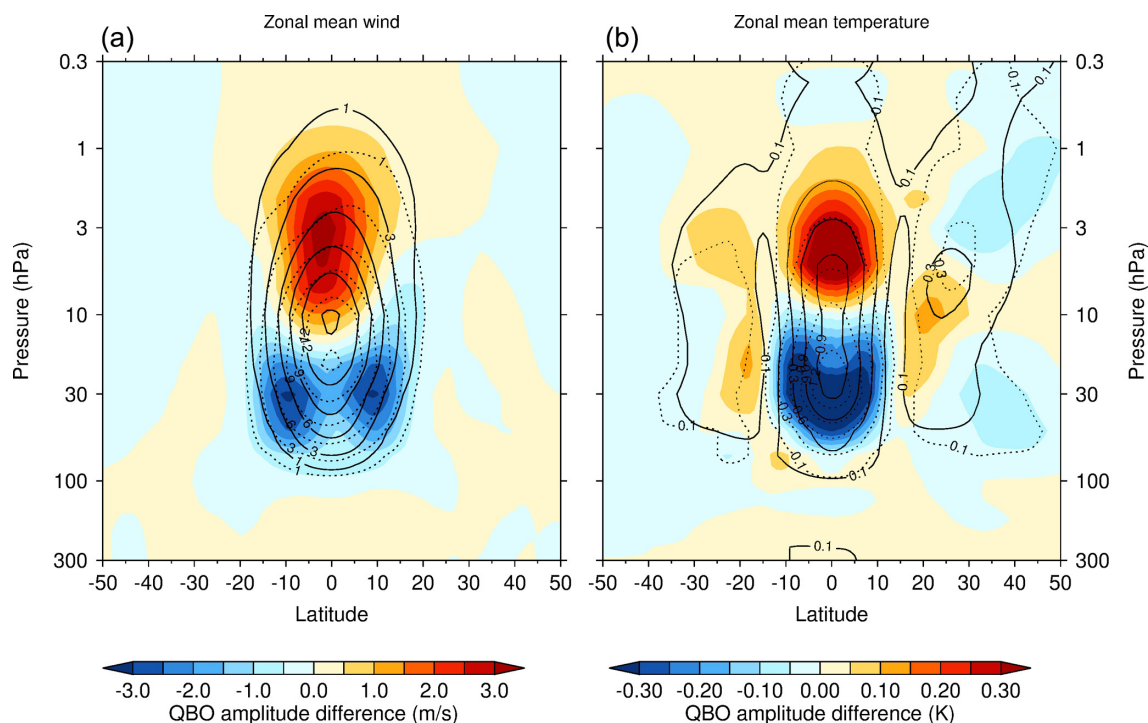

Figure 4. Comparison of Quasi-Biennial Oscillation amplitudes in u (a) and T (b) from models (solid contours) and reanalyses (dotted contours). The colours show the models–reanalyses difference, with blue depicting an underestimation by models and red an overestimation.
