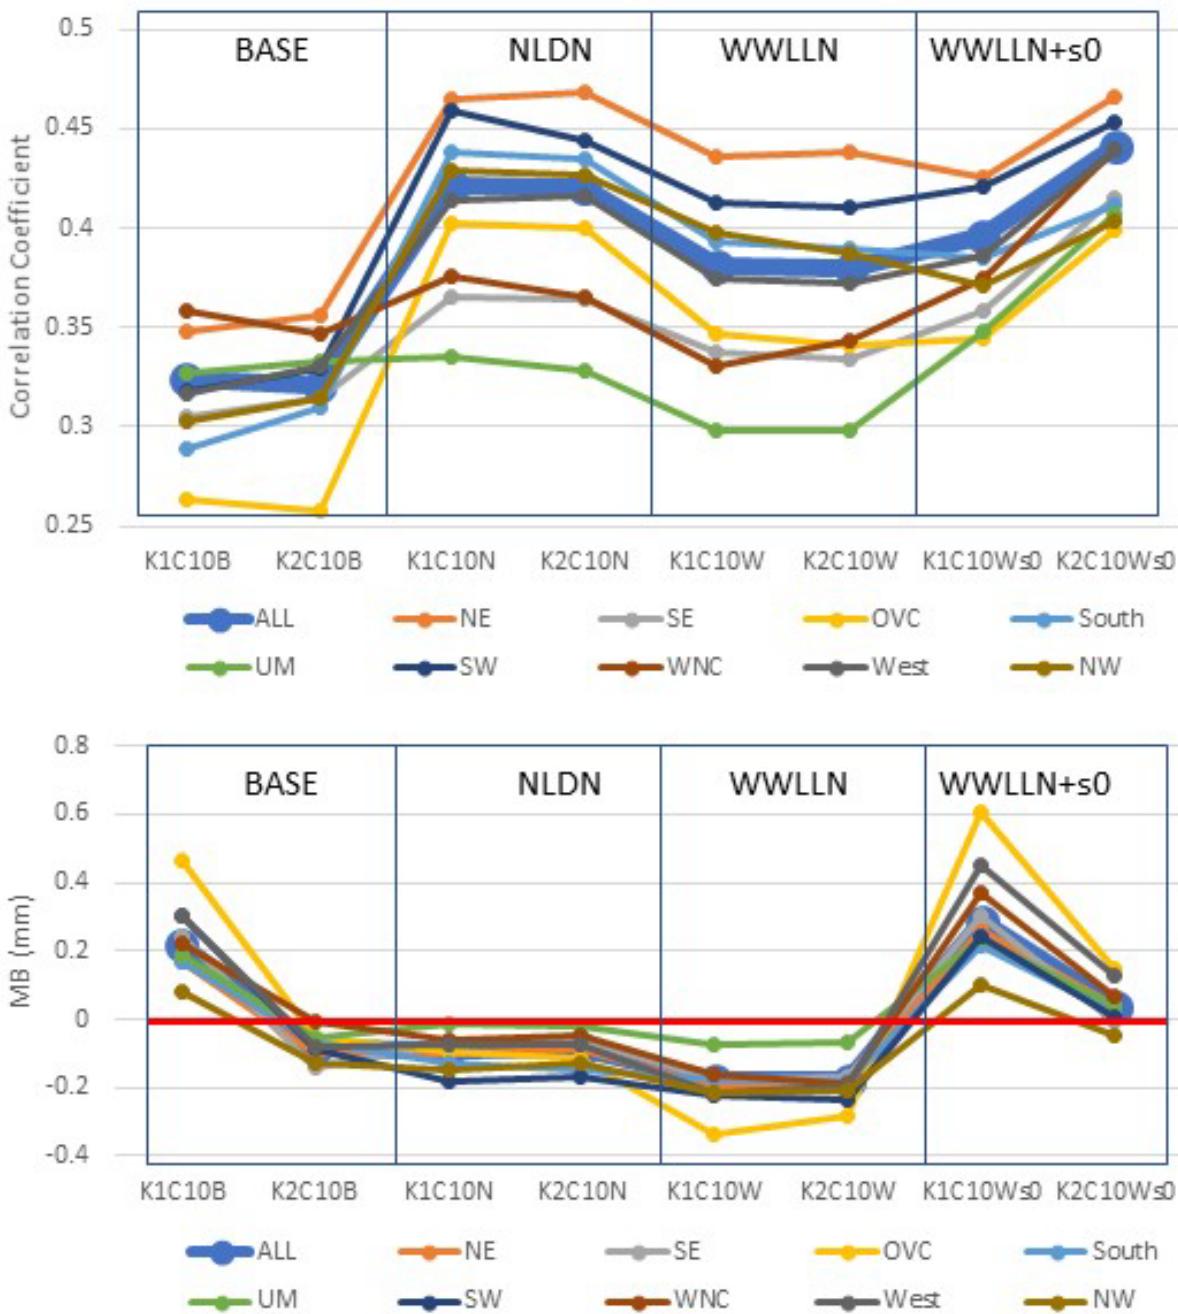

Figure S1. Monthly mean statistics (correlation coefficients and MB) for precipitation from BASE and LTA simulations for selected cases comparing to the values from PRISM for the modeling domain and the climatological regions over the CONUS, respectively, during July 2016. In each plot, there are four sets of simulations (BASE, LTA with NLDN, LTA with WWLLN, and LTA with WWLLN+s0) and each having two cases from the combinations of cumulus parameters (trigger values of 1 and 2 with cult = 10). The BASE, NLDN, and WWLLN cases are the same as in Figure 3, but the WWLLN+s0 case differs from WWLLN in that the “Suppress” option in WWLLN is “ShallowOnly” but in WWLLN+so it is “NoSuppress”, i.e., when lightning is not present, KF runs as usual (the same as in BASE cases).

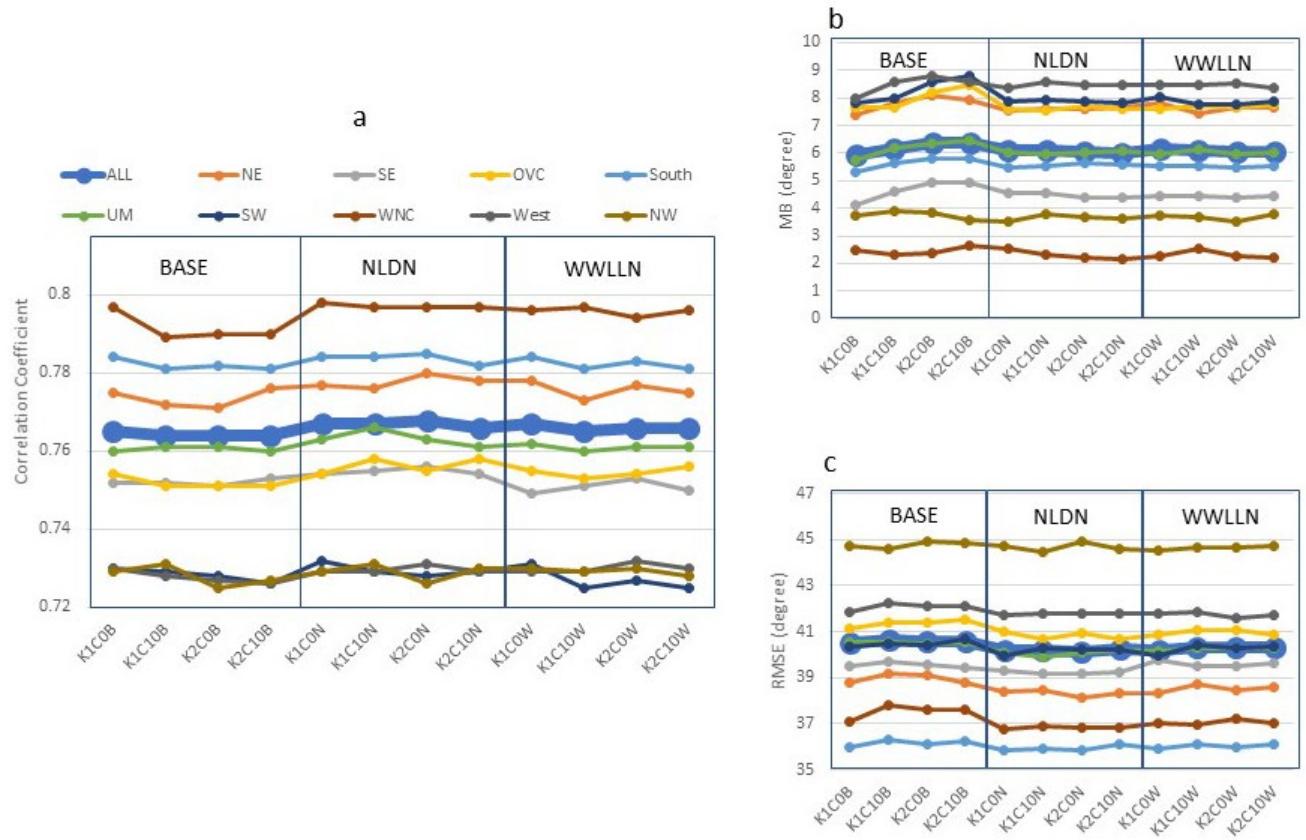

Figure S2. Same as Figure 4, but for 10-m wind direction with correlation coefficient, MB, and RMSE.

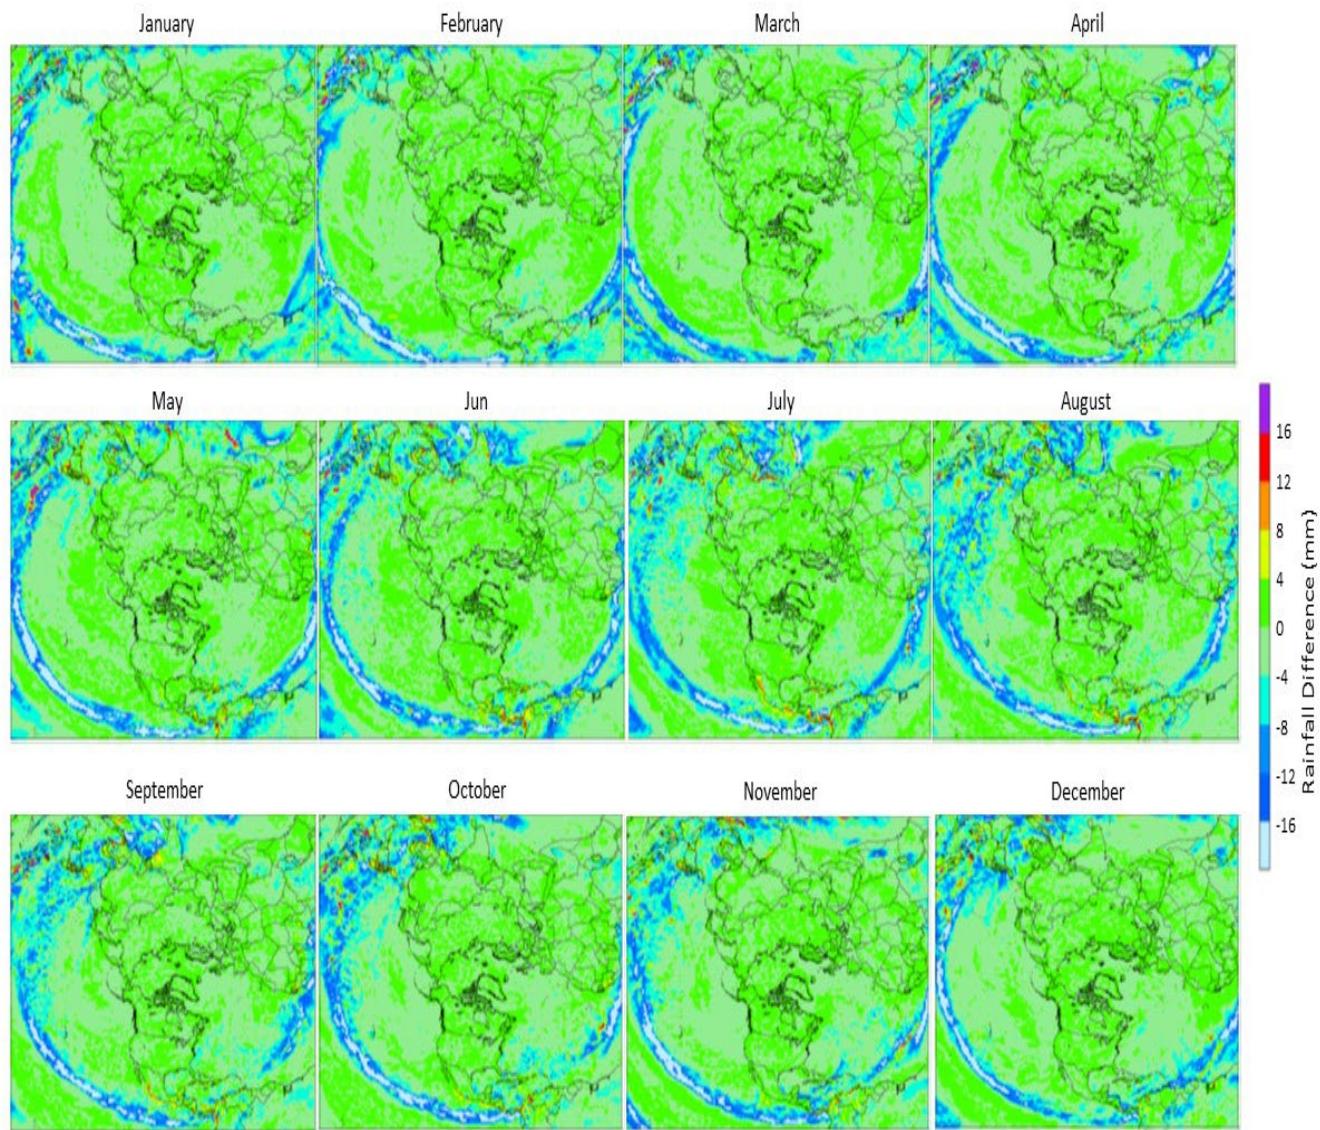

Figure S3. Monthly rainfall difference between simulations with LTA (HK1C0W) and without LTA (HK1C0B) over the northern hemisphere (HK1C0W – HK1C0B).

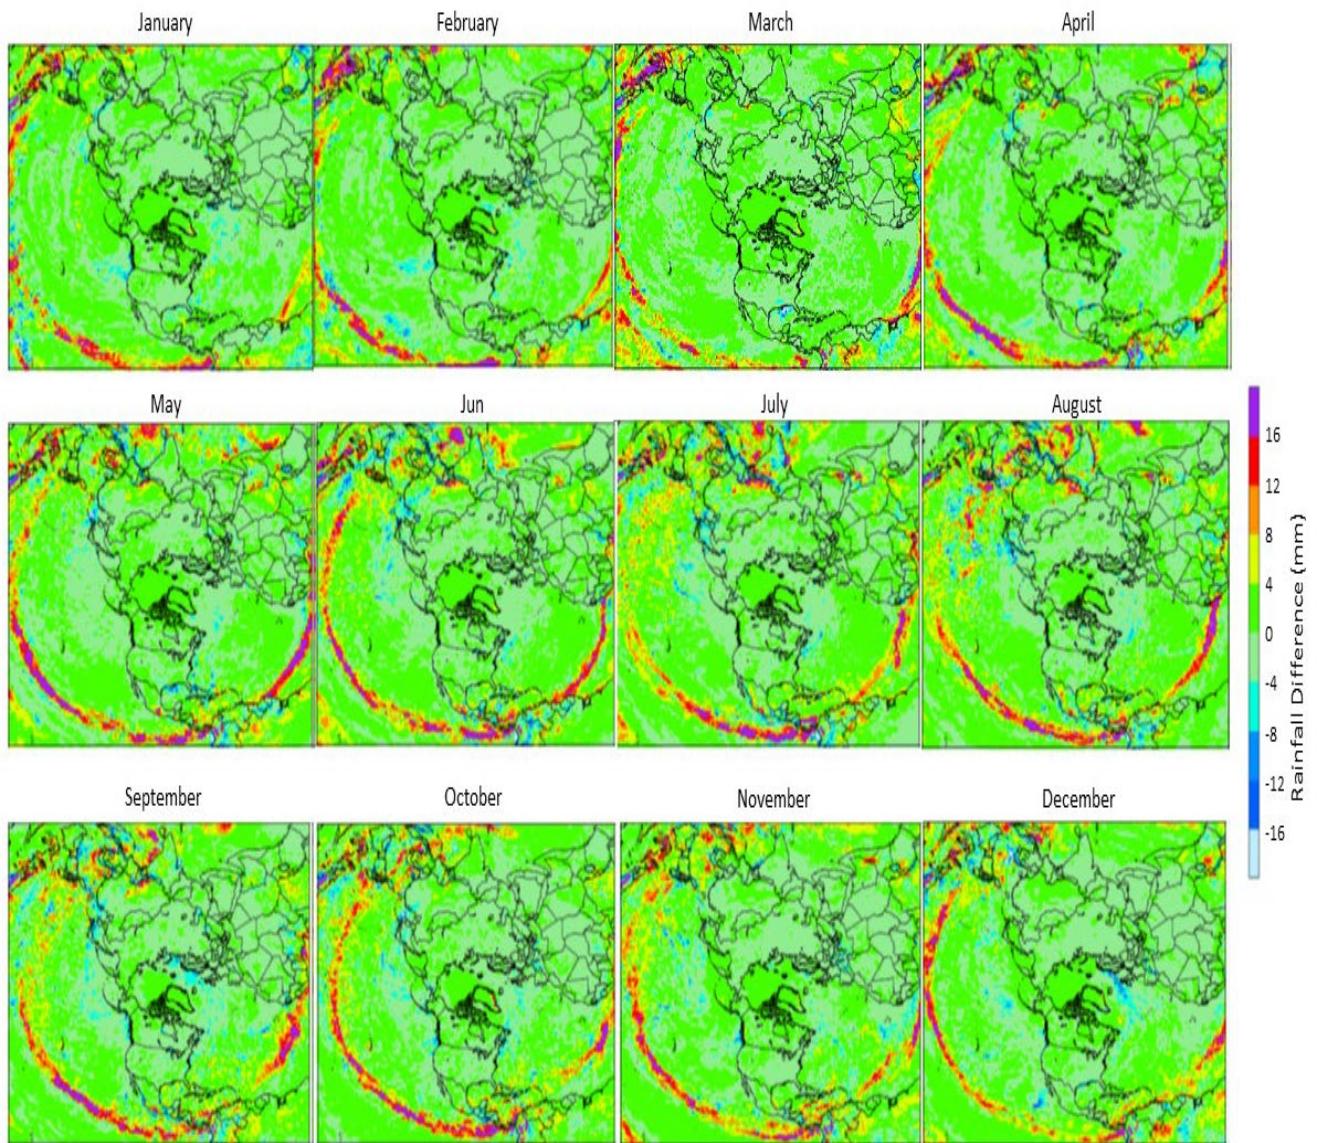

Figure S4. Monthly rainfall difference between the Base Case (HK1C0B) and The IMERG rainfall over the northern hemisphere (HK1C0B – IMERG).

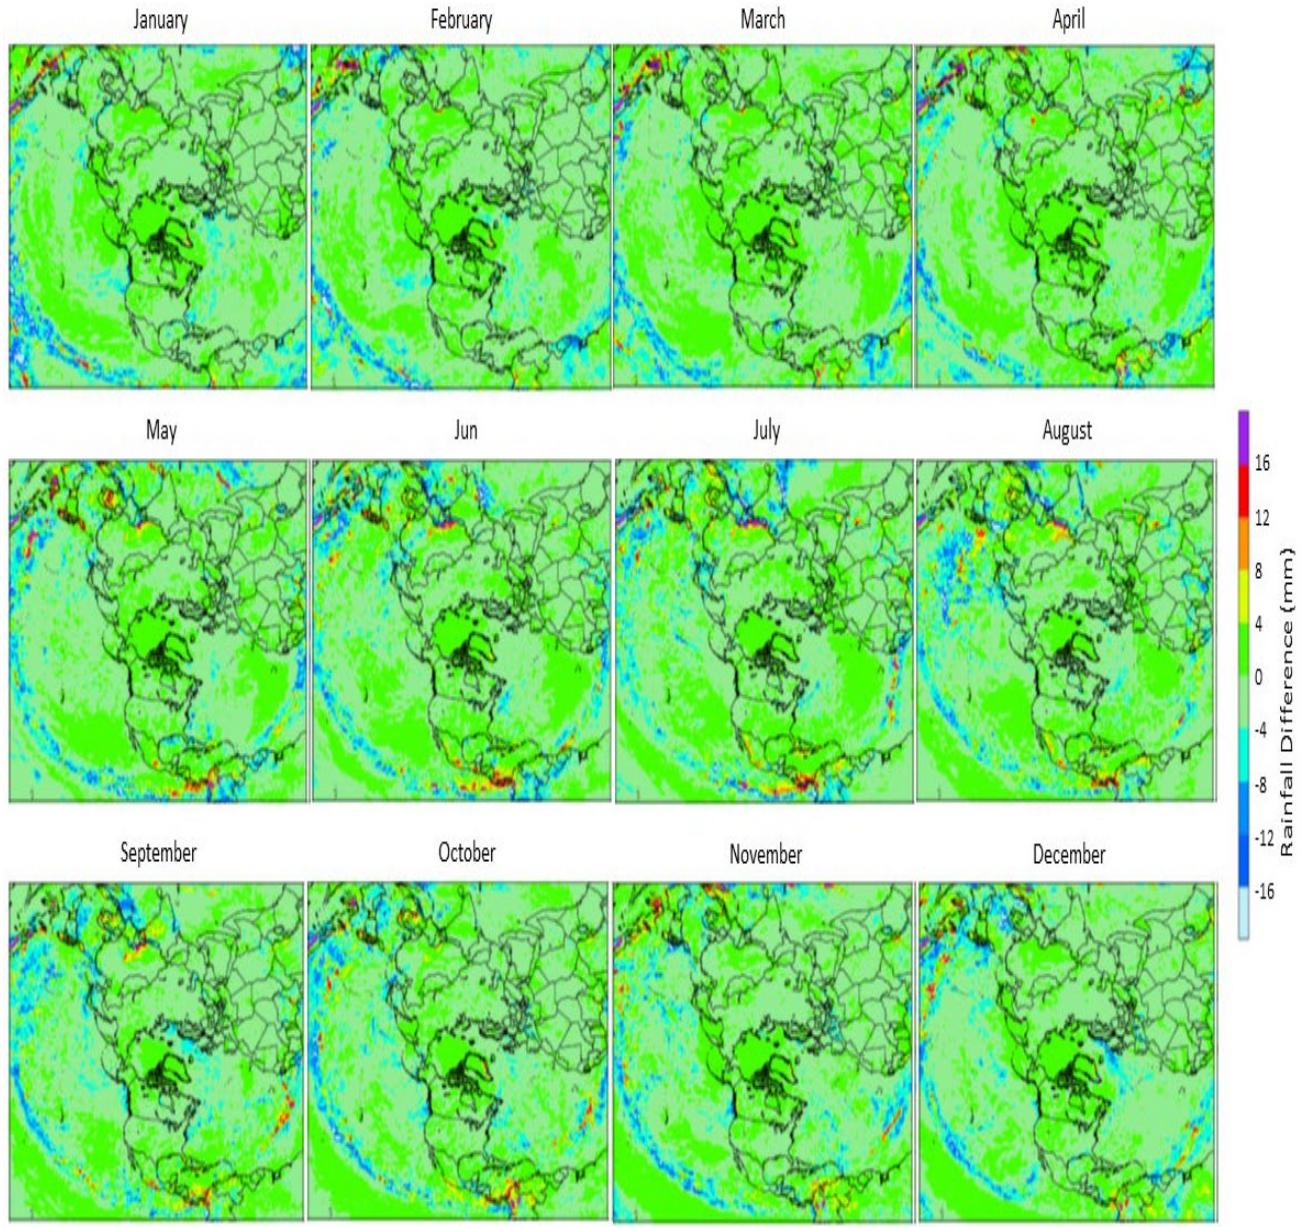

Figure S5. Mean daily rainfall difference by month between the LTA Case (HK1C0W) and The IMERG rainfall over the northern hemisphere (HK1C0W – IMERG).

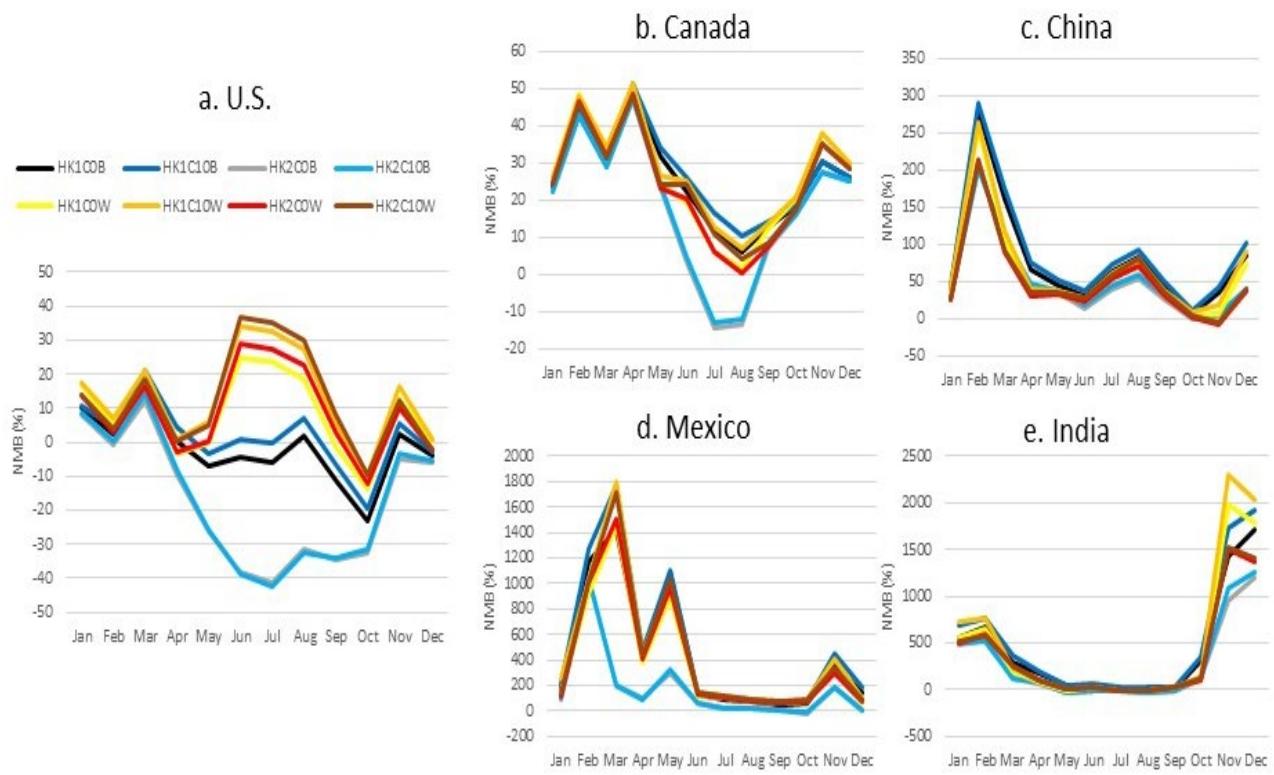

Figure S6. Same as Figure 8, but for NMB.

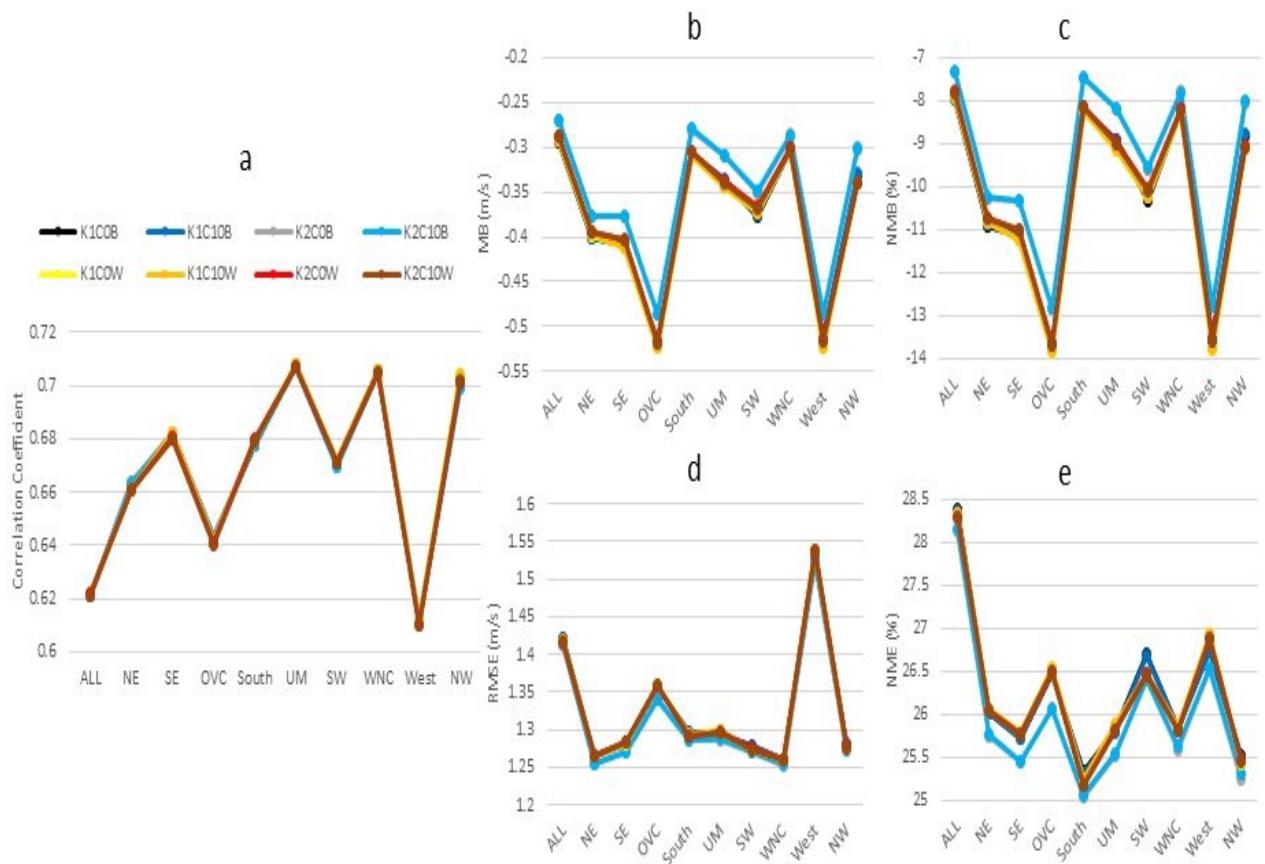

Figure S7. Same as Figure 12, but for 10-m wind speed.

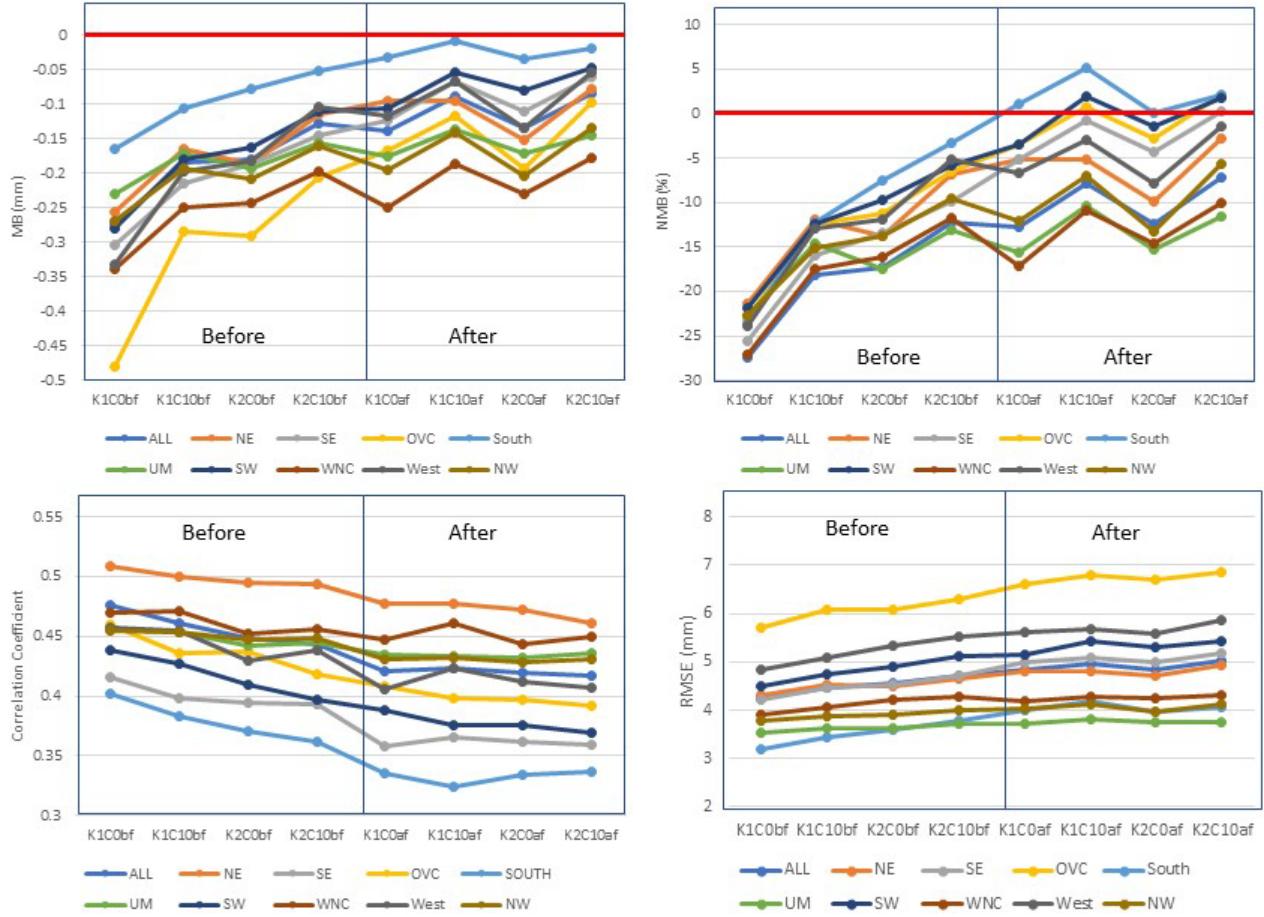

Figure S8. The change of precipitation statistics before and after the LTA updates. The bf stands for before and af stands for after with the case names, and the other part of the names are the same as earlier figures.
