Dear Robert Marsh,

regarding the manuscript type, I am not sure. NEMOTAM on its own is not really a model as we usually define them, nor a stand alone software independent of NEMO. It could be seen as a component of the NEMO modelling system or as a tool dedicated to the analysis of said system. It has no version number on its own as it follows NEMO versions. If you think it is required, we could add in the title the NEMO version we used for the numerical applications in this paper. Would this be convenient?

We will add a "code availability" section since it is now available (the technical details were not completely sorted out when we submitted the paper)
