

Supplementary Information

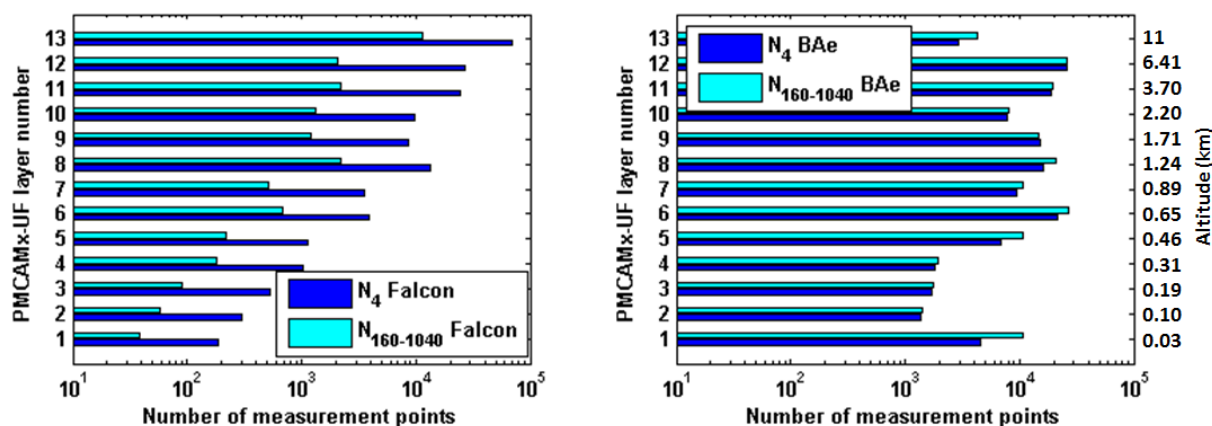

Figure S1. The availability of particle number concentration measurements as data point counts (x-axis) in the different model layers for particles larger than 4 nm (N_4) and particles with sizes between 160 and 1040 nm ($N_{160-1040}$) measured by the German DLR Falcon 20 (left panel) and the British FAAM BAe 146 (right panel) aircrafts. The corresponding altitude of the layer midpoint is shown on the right-hand side of the y-axis of the right panel. Note that similarly to N_4 , the N_{10} has been measured by the same instrument onboard the Falcon 20 which results in the same data availability as N_4 .

Figure S2. Comparison of PMCAMx-UF predictions vs. measurements of daily-averaged gas phase concentration (cm^{-3}) of sulfuric acid (H_2SO_4) during May 2008 for the site Melpitz, Germany. Lines corresponding to 1:1 (solid line), and 1:3 and 3:1 (dashed lines) are shown.
