Received and published: 14 March 2018

The manuscript describes an improved interpolation scheme for precipitation in FLEXPART, evaluates the scheme comprehensively, and suggests broader applications. It is well-written and well-presented. I have only a few minor corrections and clarifications to suggest.

1. It would be helpful to define "extensive" and "intensive" variables.
2. p.6 line 10: It would be better English to say "current" rather than "actual."

Discussion paper

3. p.10 line 2: Please check the part after "equivalently" to make sure the subscripts are correct and consistent.

4. Section 3.6.1: It would be helpful to state up front that this method is done as a second pass through the data. It becomes clear later.
