In order to maintain a high degree of reproducibility of results presented in papers GMD is strongly encouraging (but at this point does not enforce) authors to provide persistent access to their program code and data used in the manuscript. Typically this is guaranteed through the use of a DOI which can be created for releases made in GitHub using Zenodo, see <https://guides.github.com/activities/citable-code/> for details. We are aware that this is not always possible or reasonable but looking at the weak dependencies in your program code (as far as I am able to identify them) I would like

C1

to suggest that you look into the possibility to define a DOI for the version forming the basis of the manuscript results and cite this is the paper. Feel free to mention that the code is still being improved and you encourage the user to work with the newest version.

Thanks.

Lutz Gross GMD Executive Officer
