

Interactive comment on “RTTOV-gb v1.0 – Updates on sensors, absorption models, uncertainty, and availability” by Domenico CIMINI et al.

Domenico CIMINI et al.

domenico.cimini@imaa.cnr.it

Received and published: 30 March 2019

General comments:

The authors describe the atmospheric radiative transfer code RTTOV adapted for ground-based sensors (RTTOV-gb) and present some updates compared to earlier studies (e.g. De Angelis et al., 2016), by adding two more sensors and presenting model uncertainties. They test the RTTOV-gb model by comparing simulated brightness temperatures (TB) with a full line-by-line (LBL) model. Further, they compare TB simulated from radiosonde data with measured TB from co-located microwave radiometers. This approach provides a complete validation of the model, using both, the reference model and measured data as comparison. They justify the importance

[Discussion paper](#)

of the RTTOV-gb by its use to assimilate groundbased microwave radiometer data in NWP models. The paper is well written and methods and results are presented in a concise way. It presents model advances with the aim to improve NWP and fits well in the scope of GMD. I recommend to publish the manuscript in GMD after consideration of my minor comments given below.

We thank the reviewer for her/his careful reading and positive comments.

Specific comments:

p. 1, l. 23: "... computes the bottom of atmosphere radiances". What do you mean with "bottom"? Do you mean that RTTOV-gb computes radiances and brightness temperatures of the lower atmosphere/troposphere?

No. We mean that RTTOV-gb computes the downwelling radiances (and brightness temperatures) leaving the bottom of the atmosphere. The radiative transfer extends to the top of the atmosphere and it does include extra-terrestrial contribution, i.e. the cosmic background radiation. We rephrased the abstract and have added text to Section 1 to make it more clear.

p. 2, l. 4-6: Please put the first sentence of the introduction ("RTTOV-gb is the FORTRAN...") after the second sentence ("RTTOV-gb is a fast (i.e. radiances)"). The latter is a very nice introductory sentence, whereas the first gives additional information and should therefore not be the first sentence of the manuscript.

Agreed.

p.2, l.28: you mention that RTTOV-gb is one-dimensional: clarify which dimension is meant, e.g. add " profiles at a specific location".

Agreed.

p. 2, l. 36-37: "added as options" is not clear.

Agreed. We replaced with “added among the setting options”.

p. 2, l. 37: evaluation of what? Add e.g. "evaluation of RTTOV-gb against".

Agreed.

p. 3, l. 5: I suggest to place the second paragraph (p. 3, l. 15) after the first sentence in line 5. This would first generally describe the new sensors and thus provide a direct link to the title of the section (New sensors). Afterwards, it would describe the more specific information concerning the parametrization and the coefficients.

Agreed.

p. 3, l. 10: Reference to Sect. 2.2, where the regression coefficients are explained in more detail.

Agreed.

p. 3, l. 18: Mention also the study of Stahli et al. 2013 (doi:10.5194/amt-6-2477-2013), which first described the TEMPERA instrument.

Agreed.

p. 3, l. 20: "LWP family": mention the sensors from p. 5, l. 23-24 already here, because this is the section where you describe the new sensors.

Agreed.

p. 3, l. 22: Please add some more information about the channels of the sensors used, or reference to Table 2 not only for the supported sensors, but also for their channels.

Agreed.

p. 4, l. 8: Clarify that it is not the first study that uses both models. E.g. "both ... models are now available and were first presented in Cimini et al. (2018). Extending the results ...".

Printer-friendly version

Discussion paper

We mean that both models are now available within RTTOV-gb. This was not true at the time of Cimini et al. (2018). We added text to make it clear.

p.4, l. 21-22: I suggest to move these 2 sentences to p.4, l. 8, where Cimini et al. and the broader frequency range of the present study has been mentioned first.

We see the reviewer's point. But the 2 sentences at lines 21-22 assume the reader is aware of the sensitivity study approach (summarized in lines 12-20) and thus should follow the summary. Therefore, we prefer to keep the current order.

p. 4, l. 23-24: "water vapor self-broadened continuum temperature dependence exponent ncs": The long noun cluster is confusing. I prefer a description similar to Cimini et al. (2018), e.g. "... the temperature-dependence exponent ncs of the water vapor self-broadened continuum ..."

Agreed.

p. 4, l. 32: Section 3 is rather long compared to the other sections. I suggest to divide the section into two subsections, one about the comparison with the reference LBL model (starting in p.4, l. 34) and the second one about the comparison with the real observations (starting in p. 5, l. 19).

Agreed.

p. 5, l. 4: What does "main differences" mean? Please remove "main".

Agreed.

p. 5, l. 5: Add "generally" before "decrease" and "increase", because this behaviour is not valid for all of the channels (e.g. Table 3, ch. 1 first increases, and Table 5, ch. 5 first decreases).

p. 5, l. 5: Add Table reference or sensor type for clarity, e.g. "..., the rms differences GENERALLY decrease for 50-57 GHz channels (TEMPERA, Table 3), while they increase for 23/31 and 70-150 GHz channels (LWP, Table 4)".

Discussion paper

Both agreed.

p. 5, l. 8: add "(RTTOV-gb)" to "fast model approximation" to clarify which model is meant.

Agreed.

p. 5, l. 5: Which angle is used for this "fast parametrization uncertainty" in Table 5?

As specified in the caption of Table 5, the considered angle is Zenith (i.e. 90° elevation). We have now added this information within the text as well.

p. 5, l. 19: Begin a new section (see comment above, p. 4, l. 32).

Agreed.

p. 5, l. 27: Please mention already here that these datasets cover two different meteorological conditions, namely midlatitude summer and midlatitude winter conditions.

Agreed.

p. 5, l. 34: Which altitude limits for the calculations do you generally use? Do the radiosondes cover this whole altitude range?

The pressure limits are given in Table 1, which cover from surface to the top of the atmosphere. Radiosondes usually reach up to 10 hPa (30 km altitude), leaving the uppermost 5 levels to be covered with climatological profiles. This has negligible impact on ground-based radiance calculations. We added text in Section 3.2 to clarify.

p. 6, l. 4: Why did you choose a threshold of 0.2K when reducing the 0.5K threshold from 1h to 10 minutes?

We assume that the clear-sky atmospheric variability decreases with decreasing time interval. By plotting $\sigma(T_b(30\text{GHz}))@10\text{m}$ in increasing order, we notice a steady slope up to 0.2K (which we assume is due to the clear-sky variability) followed by a rapid increase (associated to cloud contamination). Thus, we set 0.2K as the threshold

Discussion paper

for $\sigma(T_b(30\text{GHz}))@10\text{m}$ to indicate clear-sky conditions. We rephrased the text to clarify.

p. 6, l. 5: It would be nice to mark these identified cloudy periods in Figure 3 and Figure 5.

Agreed.

p. 6, l. 11: Could you provide some more details? What do you mean with conditions-dependent uncertainties?

The 72.5 GHz channel is influenced by both temperature and water vapor, and thus its uncertainty. Figure 2 suggests that the uncertainty at 72.5 GHz increases as temperature decreases, while it decreases as moisture increases. Thus, the different slope in Figure 4 may be partially due to increasing uncertainty at lower temperature and moisture conditions. We added text in Section 3.2 to clarify.

p. 6, l. 18: It is interesting to mention here the meteorological conditions for the dataset. Please mention earlier also the conditions for the Milan dataset (see comment above, p. 5, l. 27).

Agreed.

p. 7, l. 5: Besides in the manuscript title and the Abstract, it is the first time here that you mention the version (v1.0) of RTTOV-gb, and you continue to do so during the whole summary section. Please mention the version earlier in the text and be consistent in the usage.

Agreed. We have added the version number where deemed appropriate.

p. 7, l. 16: I think you can be more confident here. I suggest to change it to "This paper can provide ...".

Agreed. We changed into "We expect this paper will provide. . ."

p. 8, l. 20: For completeness, also state where RS98 is available.

The R98 code is no longer supported and thus it is not available through a repository.

p. 17, Fig. 1: Adapt figure titles ("ros17" and "rosen") to R17 and R98 to be consistent with the text.

Agreed.

p. 18, l. 3: Kp is not defined, do you mean Cov(p)?

Correct. We modified the caption accordingly. Thanks much for spotting this typo..

p. 19, Fig. 3: Add unit (GHz) to the legend. Also, it would be nice to mark cloudy periods (see comment p. 6, l. 5).

Agreed.

p. 19, l. 3: add "radiosondes used for the simulations ...". Otherwise it is not clear why you mention radiosondes here in the caption.

Agreed.

p. 20, Fig. 4: the x-labels of the first two panels are cut.

Addressed. Thanks.

p. 21, Fig. 5: Same comment as for Fig. 3, add unit to legend and mark cloudy periods.

Agreed.

Technical corrections:

p. 1, l. 33: Typo, according to the tables it should be 82.5.

p. 2, l. 22: Data assimilation (DA): abbreviation not needed, because it is not used later on.

p. 2, l. 31: "As hoped" is not appropriate here, state it as a fact.

Printer-friendly version

Discussion paper

- p. 2, l. 38: "Section 5 provideS"
p. 3, l. 19: "Liquid Water Path (LWP)". Introduce the abbreviation LWP.

All the above are agreed. Thanks!

- p. 3, l. 35: Provide definition of AMSUTRAN.

Since AMSUTRAN is not used here, we prefer to refer to the original publication (Turner et al., 2019) for definition and further details.

- p.4, l. 7: remove blank space before ")".
p. 4, l. 25: "the same approach AS described in ..."
p. 4, l. 27: bold typesetting of Cov(...) and Cor(...) for consistency.

All the above are agreed.

- p. 6, l. 2: Missing space after TB
p. 6, l. 5: Missing space after TB
p. 6, l. 22: Missing space after TB
p. 6, l. 24: Missing space after TB

With TB(90GHz) we intend TB at 90 GHz, so we prefer to keep this compact notation.

- p. 12, l. 1: Add "with the corresponding sensor channels (sensor chans)."
p. 13, Table 3: Add a digit to the Central frequencies to be consistent with the number of digits in the other columns and in Table 5.
p. 14, Table 4: Same as for Table 3, add a digit to the channel frequencies.
p. 15, Table 5: Add units for the uncertainties.
p. 20, l. 7: add "and": AVG, STD, SDE, and RMS

All the above are agreed. Thanks!
