Received and published: 4 March 2019

It is an important paper about emissions. Some questions after reading it are the following:

- 1) It is not clear what year the emissions are valid.
- 2) There is not shown a methodology validation for Eq 1. If someone used the emission output results for every single hour and added for a year, in the same selected area, he should have the initial emission value of that area. Is it done before?
- 3) Figure 5 page 33 Emission from Beijing and Delhi looks the same. Is it true?
