The work is very interesting, relevant to the broader context of urban planning and ecosystem services, and presents the model and underlying information and references clearly. The manuscript is well-written and I only have very minor suggestions for revision:

I suggest one minor revision: Adding more detail on how the tree shading coefficient (S_i) was calculated (page 6, line 116 to 118) by way of an equation. The other components (ET_I, CC_i) have accompanying equations to make their derivation clear to the reader.

I also found a minor technical correction on page 7, line 143: "biophyisical" should be "biophysical".
