C1

Interesting paper that presents a model that considers homogeneous and heterogeneous chemistry.
Some remarks and suggestions.

- The English must be improved in all parts of the paper.
- page 1, line 8, "The model succeeds in simulating correctly", what you mean by correctly, please to precise, e.g., give error values comparing simulations and experiments
- page 4, line 107 suggestion to replace "master equation" mass balance equation "
- page 4, line 110, I suggest presenting a simple schema that clearly shows the domains of L, S, the boundary of domains, and all flows and mass fluxes, this consideration will help to understand more the model
- page 5, line 121/eq2, could you explain why you multiply mS by VboxL/VboxS / same question for line 123/eq3
- page 5, line 133, ... in these experiments..., which experiments? please precise
- Page 5, ... emission of the building itself... not clear which emission? indoor emissions due to activities/appliances/furnitures?
- page 6, line 149-line 156, must present a schema that shows an example of surface projections, surface boundaries, beams with window the window position considered
- page 6, line 153, line 155, are these equations valid for each season? each window position, surface and characteristics? please to highlight the limit of these equations.
- page 12, line 339, what parameters are assigned for VOCs, not clear, VOCs concentrations?
- page 12, line 341, is slower? it seems it is lower, not clear
- page 14, line 388, how the other uptake values can be adjusted by a user? from values in the literature?
- page 25, line 534, suggestion to replace "replicate" by "to predict"
- page 25, line 735, please to review this phrase "For the first time, O₃, HONO and NO_x species are simulated all at once and compared to experimental records acquired in a real room". is it the first study that estimates experimentally O₃, HONO and NO_x concentrations in a real environment?
- page 25, line 737 and line 738, please review this phrase "It is also the first two-box model allowing to consider the variations of direct and indirect light throughout the day". please to more explicit about this consideration by making the link with the study
