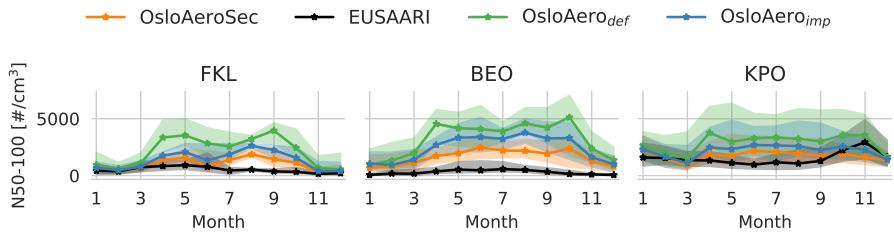

Figure S1. N_{50-100} monthly median (solid line) and percentiles (shaded, 16th to 84th) for stations with high concentrations. The plot is the same as 4, but displaying the full range of values which were cropped in figure 4.

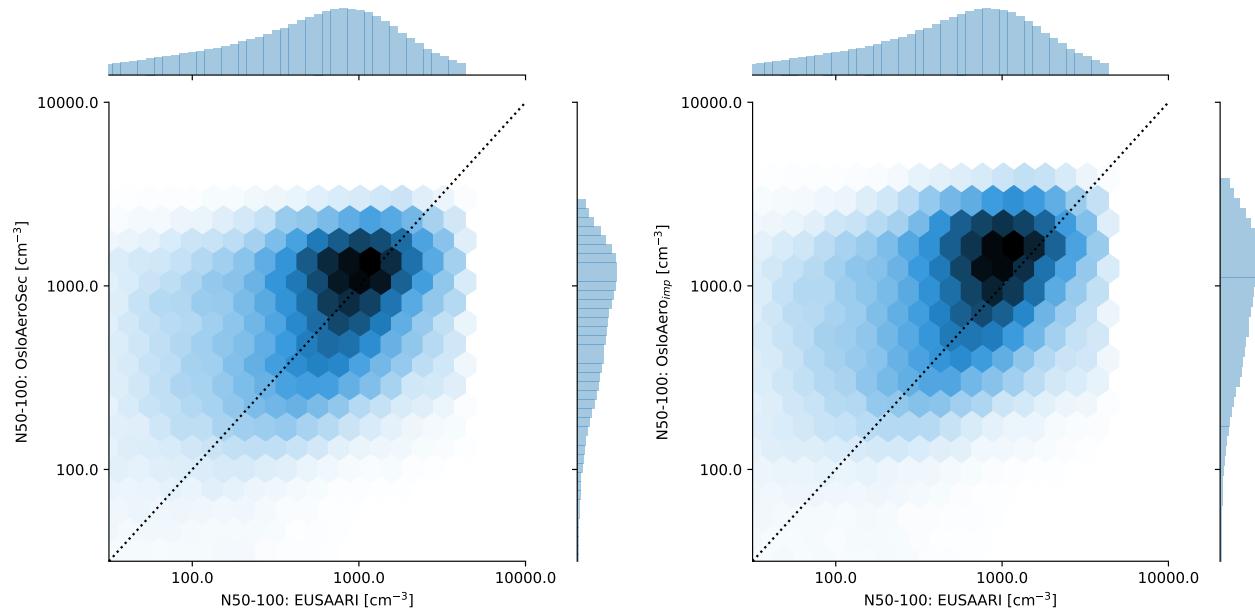

Figure S2. Two dimensional density distribution plots for N_{50-100} between modelled values (y-axis) and EUSAARI observations (x-axis). The left plot shows the relation for OsloAero_{Sec} and the right for OsloAero_{imp}.

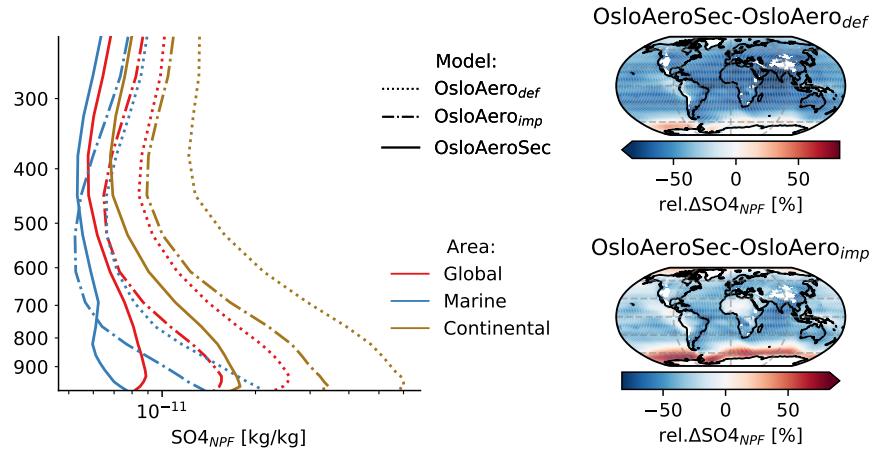

Figure S3. NPF particle mass in sectional scheme from H_2SO_4 (SO_4_{NPF}). The plot to the left shows the average profiles over regions (global, marine and continental). The plots to the right show the near-surface average difference between OsloAeroSec and OsloAero_{def} (top) and OsloAeroSec and OsloAero_{imp} (bottom).

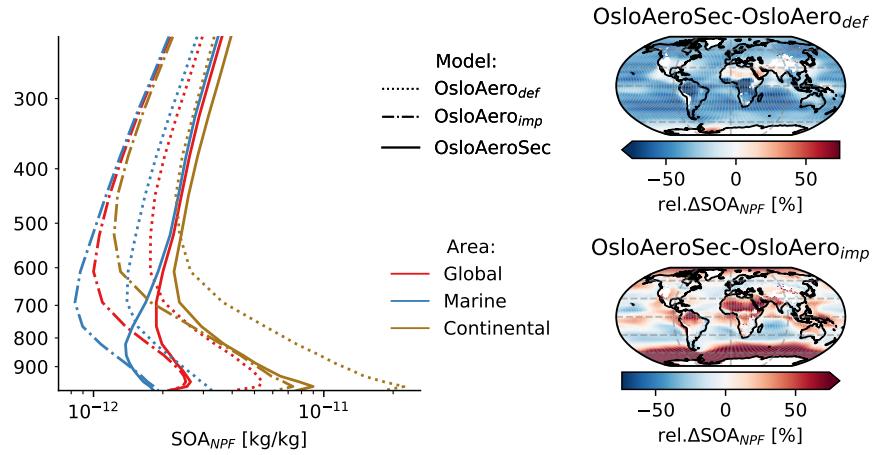

Figure S4. NPF particle mass in sectional scheme from SOAG_{LV} (SOA_{NPF}). The plot to the left shows the average profiles over regions (global, marine and continental). The plots to the right show the near-surface average difference between OsloAeroSec and OsloAero_{def} (top) and OsloAeroSec and OsloAero_{imp} (bottom).

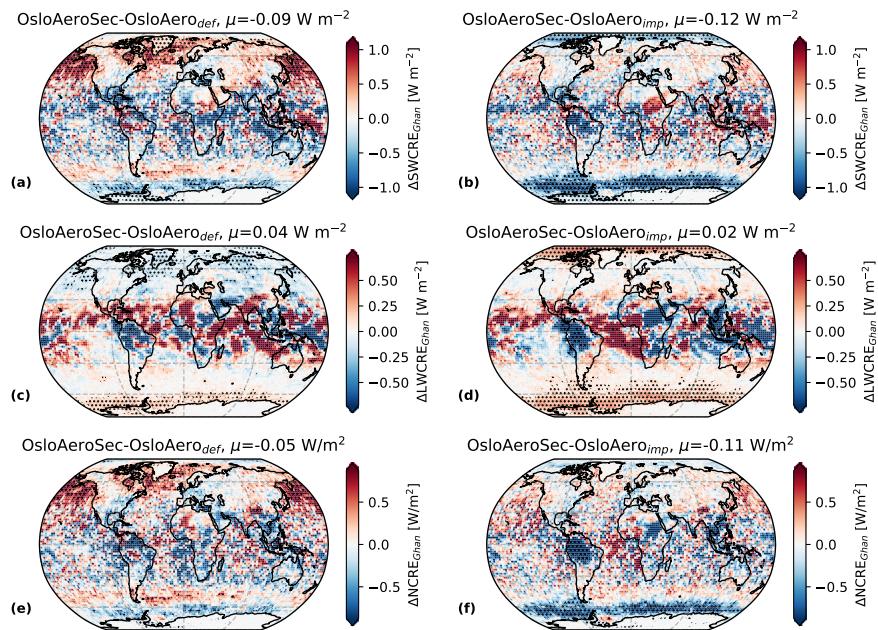

Figure S5. Difference in cloud radiative effect (CRE) for OsloAeroSec – OsloAero_{def} (left) and OsloAeroSec – OsloAero_{imp}. Short wave CRE (SWCRE, top), long wave CRE (LWCRE, middle) and net CRE (NCRE, bottom)

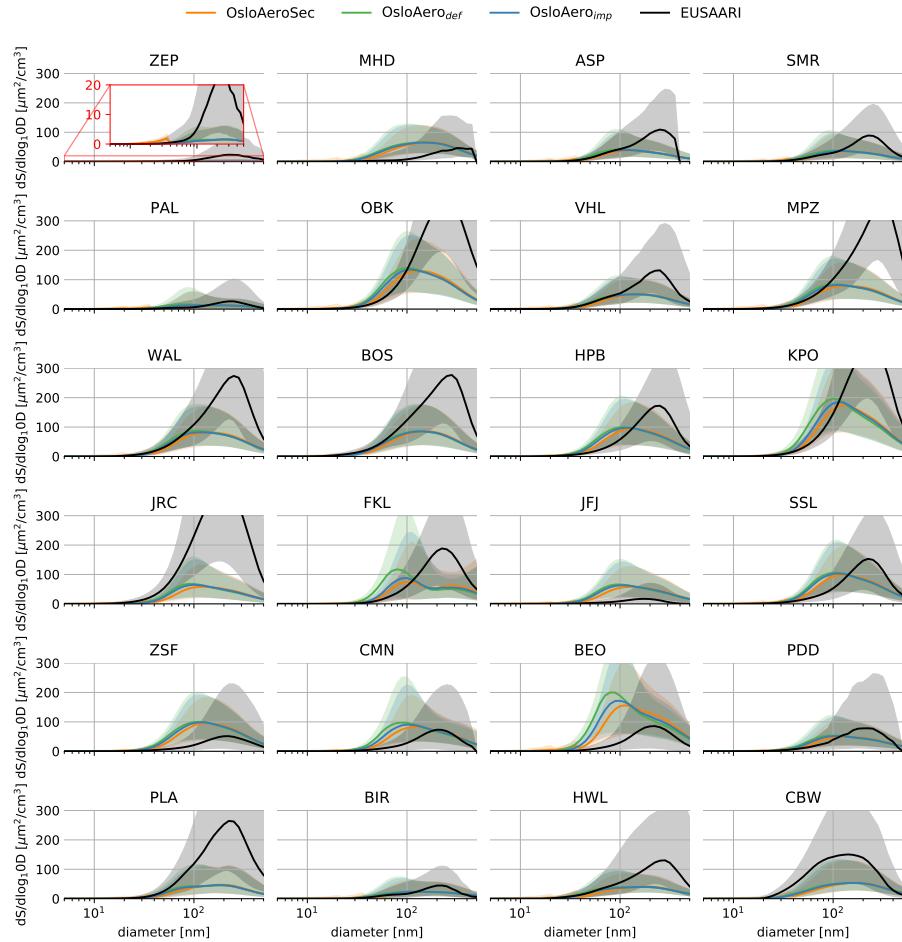

Figure S6. Median (solid line) particle surface size distribution and shading from 16th to 84th percentiles for observations and models. All data when and where observations are available is included.

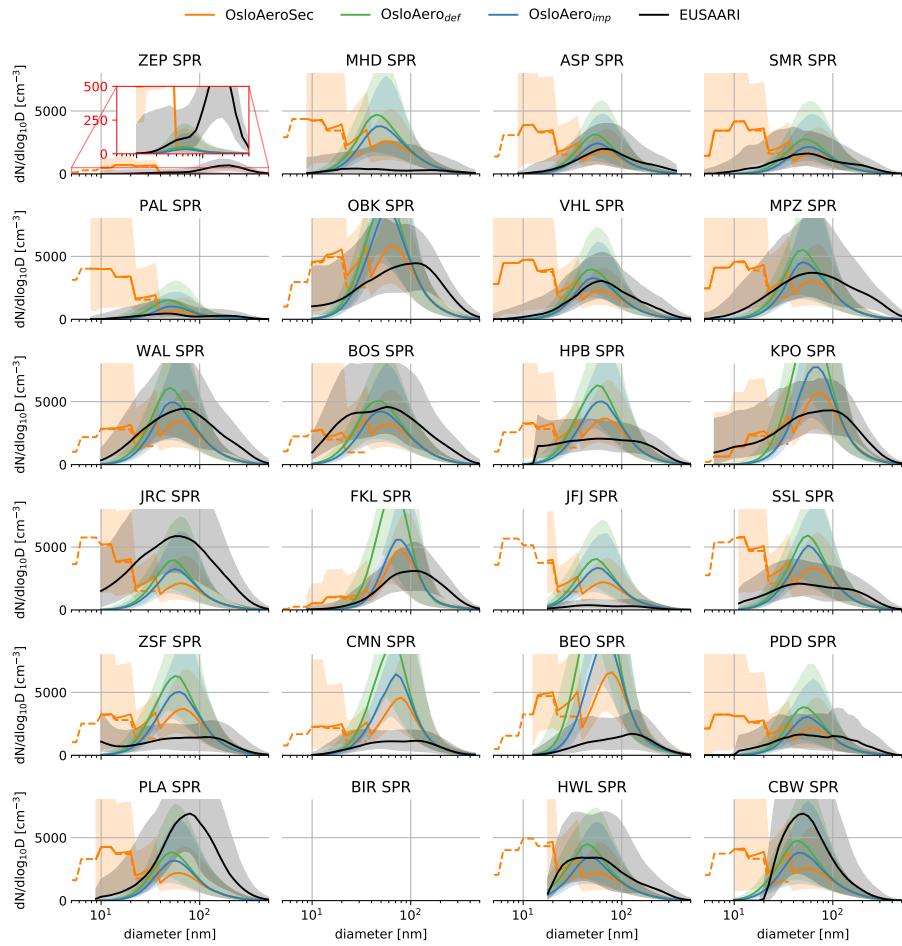

Figure S7. Spring: Median (solid line) and shading from 16th to 84th percentiles for observations and models for all valid datapoints.

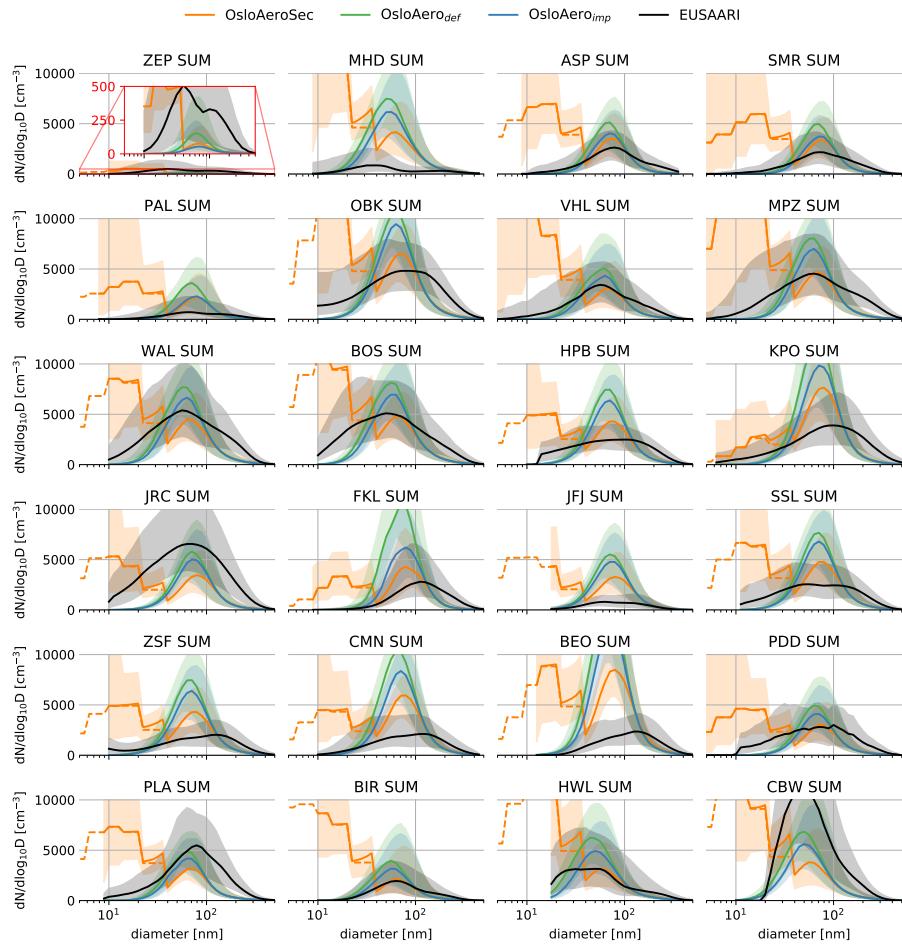

Figure S8. Summer: Median (solid line) and shading from 16th to 84th percentiles for observations and models for all valid datapoints.

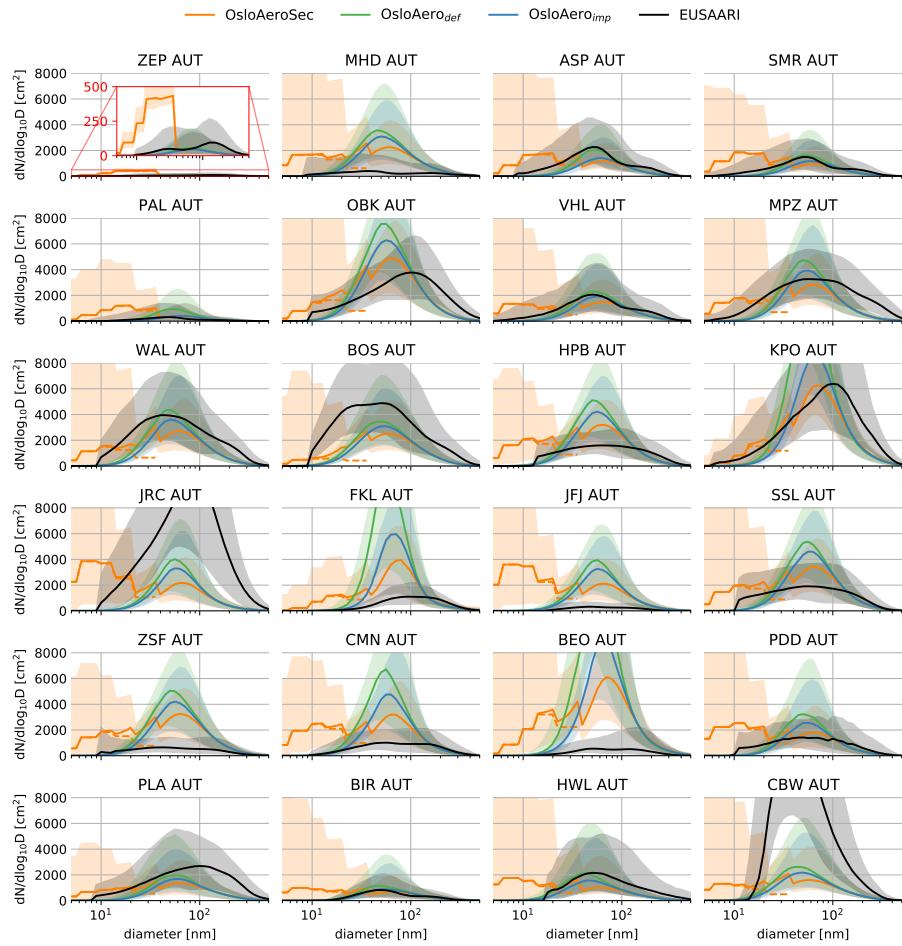

Figure S9. Autumn: Median (solid line) and shading from 16th to 84th percentiles for observations and models for all valid datapoints.

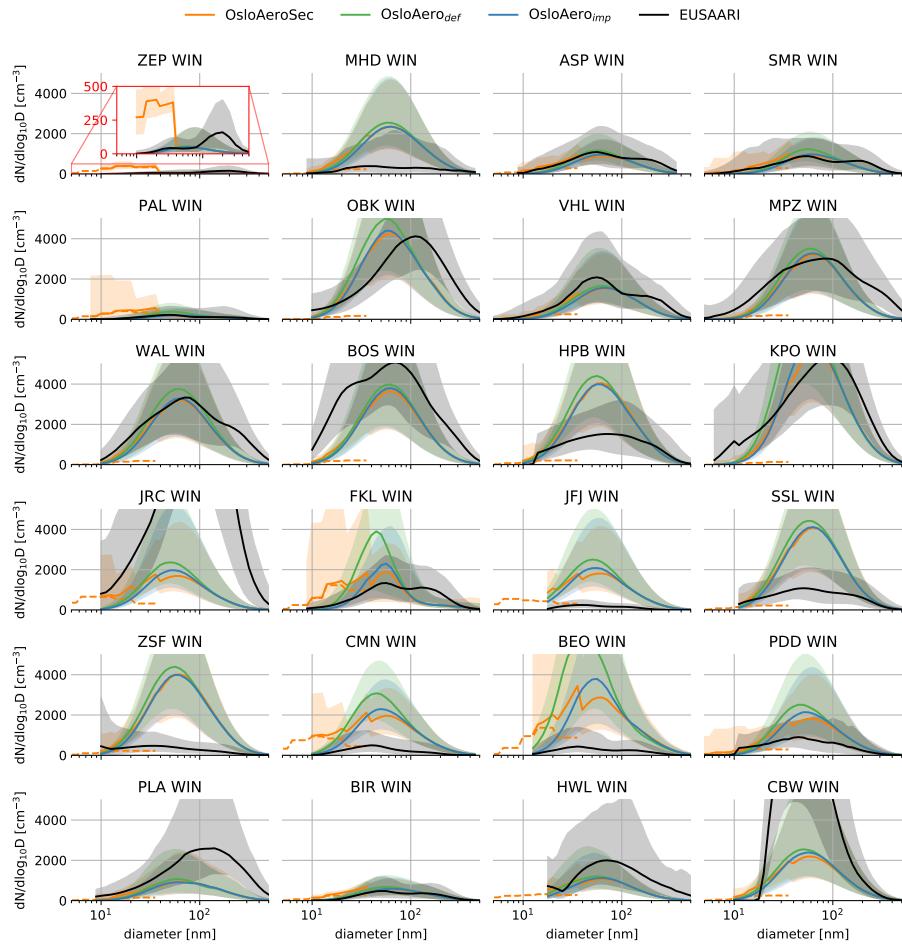

Figure S10. Winter: Median (solid line) and shading from 16th to 84th percentiles for observations and models for all valid datapoints.

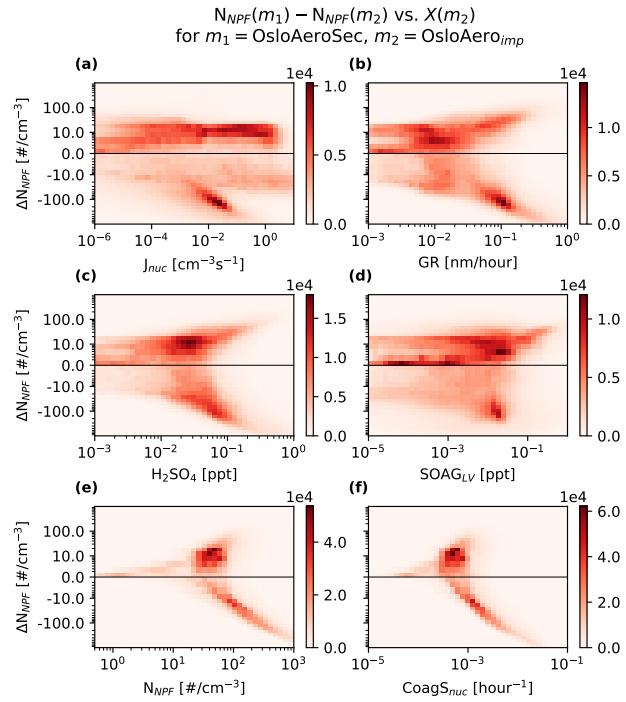

Figure S11. Same as 10, but comparing to OsloAero_{def}, rather than OsloAero_{imp}. Two-dimentional histogram of the relation between various factors in the original model run OsloAero_{imp}, and the change in number of particles from NPF, N_{NPF} between OsloAeroSec and OsloAero_{def}. The color shows the number of model grid cells which fall within the x,y-range using monthly mean files. Only grid cells below 100 hPa are included. The y-scale is linear between ± 5 .

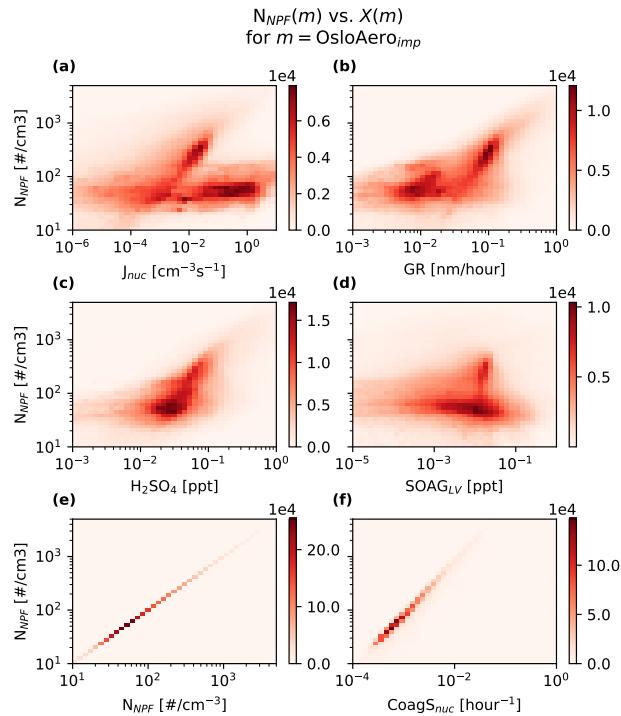

Figure S12. Two-dimensional histogram of the relation between N_{NPF} and various factors in the OsloAero_{imp} simulation. 10, The color shows the number of model grid cells which fall within the x,y-range using monthly mean files. Only grid cells below 100 hPa are included.

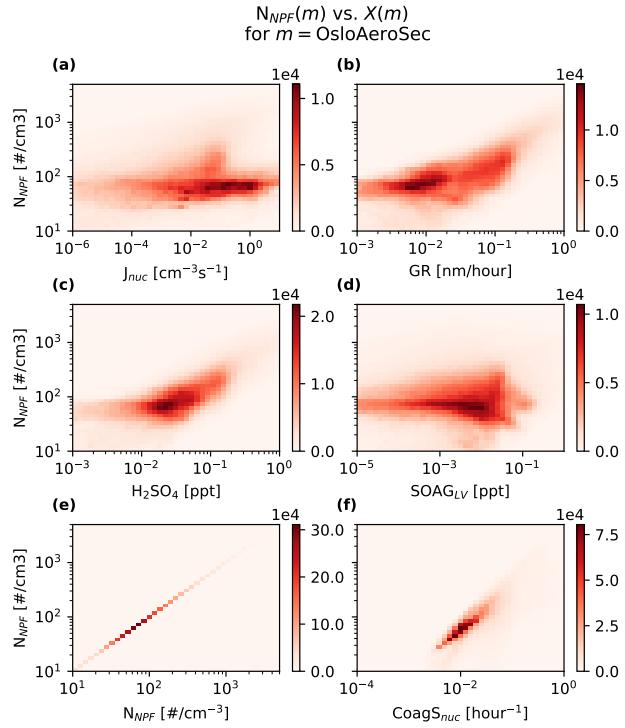

Figure S13. Two-dimensional histogram of the relation between N_{NPF} and various factors in the OsloAeroSec simulation. 10, The color shows the number of model grid cells which fall within the x,y-range using monthly mean files. Only grid cells below 100 hPa are included.
